#### A Black Box

- Can Construct Solution to Model Without Really Understanding It
- Hard Even To Be Sure Your Numerical Solution Is Right
- Little Intuition for How Results Might Change With
  - Calibration
  - Structure
- Very Hard To Teach!

- Have Done A Good Deal Of Work With Them Myself
- But As A Result, Have Felt All These Drawbacks Keenly

# The Gap This Paper Fills

Foundations For Microeconomic Household's Problem With

- Uncertain Labor Income
- No Liquidity Constraints
- CRRA Utility
- (Problem with Liquidity Constraints Is A Limiting Case)

# The Gap This Paper Fills

Foundations For Microeconomic Household's Problem With

- Uncertain Labor Income
- No Liquidity Constraints
- CRRA Utility
- (Problem with Liquidity Constraints Is A Limiting Case)

# Key Result

Restrictions On Parameter Values Such That

- Problem Defines A Contraction Mapping
  - $\Rightarrow \exists$  A Unique Consumption Function c(m)
- There Is A 'Target' Ratio Of Assets to Permanent Income
  - Requires A Key 'Impatience' Condition To Hold
  - Good News
    - Condition Is Weaker (Easier To Satisfy) Than Previous Papers Imposed

Limit as horizon T goes to infinity of

$$\max \mathbb{E}_t \left[ \sum_{n=0}^{T-t} \beta^n u(c_{t+n}) \right] \tag{1}$$

$$a_{t} = m_{t} - c_{t}$$

$$b_{t+1} = a_{t}R$$

$$\boldsymbol{\rho}_{t+1} = \boldsymbol{\rho}_{t} \underbrace{\Gamma \psi_{t+1}}_{\equiv \Gamma_{t+1}}$$

$$m_{t+1} = b_{t+1} + \boldsymbol{\rho}_{t+1} \xi_{t+1},$$
(2)

$$\xi_{t+n} = \begin{cases} 0 & \text{with probability } \wp > 0 \\ \theta_{t+n}/\wp & \text{with probability } \wp \equiv (1 - \wp) \end{cases}$$
 (3)

• 
$$u(\bullet) = \bullet^{1-\rho}/(1-\rho); \mathbb{E}_t[\psi_{t+n}] = \mathbb{E}_t[\xi_{t+n}] = 1 \forall n > 0; \beta < 1, \rho > 1$$

# Surely This Problem Has Been Solved?

No

- Can't Use Stokey et. al. theorems because CRRA utility
- Lit thru Matkowski and Nowak (2011) Can't Handle Permanent Shocks
- Must Use Boyd's 'Weighted' Contraction Mapping Theorem
- Surprisingly Subtle

Fortunately, the Conclusions Are Simple!

# Benchmark: Perfect Foresight Model

#### Definitions:

Absolute Patience Factor	Þ	=	$(R\beta)^{1/2}$
Return Patience Factor	$\mathbf{p}_R$	=	$\mathbf{P}/R$
Perfect Foresight Growth Patience Factor	$\mathbf{p}_{L}$	=	$\mathbf{P}/\Gamma$

Name	Condition		on	Implication	
(AIC) Absolute Impatience Condition	Þ	<	1	$c \downarrow$ over time	
(RIC) Return Impatience Condition	$\mathbf{p}_{R}$	<	1	$c/a \downarrow$ over time	
(PF-GIC) Growth Impatience Condition	$\mathbf{p}_{L}$	<	1	$c/\mathbf{p}\downarrow$ over time	

# When Does A Useful Limiting Solution Exist?

Finite Human Wealth (FHWC) condition:

$$\Gamma < R$$
 (4)

Return Impatience Condition:

$$\triangleright_{\mathsf{R}} < \mathsf{R} \tag{5}$$

# When Does A Useful Limiting Solution Exist?

Finite Human Wealth (FHWC) condition:

$$\Gamma < R$$
 (4)

Return Impatience Condition:

$$\mathbf{\hat{p}}_{\mathsf{R}} \quad < \quad \mathsf{R} \tag{5}$$

# What If There Are Liquidity Constraints?

- FHWC is not necessary for solution to exist
- Other Key Condition For Useful Solution is 'Perfect Foresight Finite Value of Autarky Condition (PF-FVAC)':

$$\beta \Gamma^{1-\rho} < 1 \tag{6}$$

- Without RIC, Constraints Are Irrelevant
  - Because Wealth Always Wants To Rise, So Constraint Never Binds

# What If There Are Liquidity Constraints?

- FHWC is not necessary for solution to exist
- Other Key Condition For Useful Solution is 'Perfect Foresight Finite Value of Autarky Condition (PF-FVAC)':

$$\beta \Gamma^{1-\rho} < 1 \tag{6}$$

- Without RIC, Constraints Are Irrelevant
  - Because Wealth Always Wants To Rise, So Constraint Never Binds

# Liquidity Constraints and Uncertainty

- Introduce permanent shocks to income
- Finite Value of Autarky Condition Becomes

$$\overbrace{\beta}\underline{\underline{\Gamma}}^{1-\rho} < 1$$

$$\beta < \underline{\underline{\Gamma}}^{\rho-1}$$
(7)

# Contraction Mapping Requirements

Finite Value of Autarky Condition: Same As In Liq Constr Problem!

$$\beta \underline{\underline{\Gamma}}^{1-\rho} < 1$$

$$\beta < \underline{\underline{\Gamma}}^{\rho-1}$$
(8)

'Weak Return Impatience Condition' (WRIC)

$$0 \le \wp^{1/\rho} \mathbf{p}_{\mathsf{R}} < 1 \tag{9}$$

# Requirement For Existence Of A Target

Definitions: 'Uncertainty-Adjusted' Growth:

$$\underline{\Gamma} = \Gamma \dot{\psi} \tag{10}$$

Adjusted Growth Patience Factor:

$$\mathbf{\dot{p}}_{\dot{\Gamma}} = \mathbf{\dot{p}}/\underline{\Gamma} \tag{11}$$

Growth Impatience Condition:

$$\mathbf{P}_{\dot{\Gamma}} < 1 \tag{12}$$

Why? Because it can be shown that

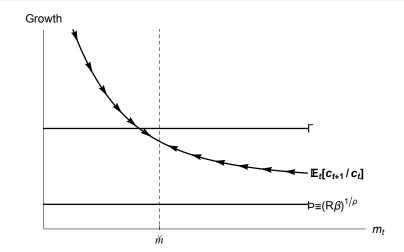

$$\lim_{m_t \to \infty} \mathbb{E}_t \left[ \frac{m_{t+1}}{m_t} \right] = \mathbf{p}_{\hat{\Gamma}} \tag{13}$$

# Five Propositions

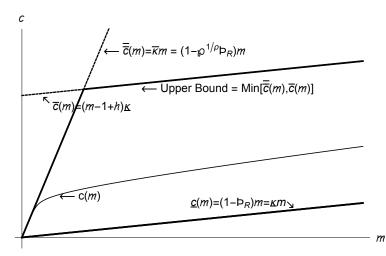

$$\mathbf{0} \ \lim_{m_t \to \infty} \mathbb{E}_t[c_{t+1}/c_t] = \mathbf{P}$$

**③**  $\exists$  a unique target value of m, called  $\check{m}$ 

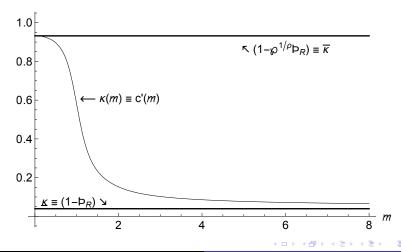

# The Target Saving Figure

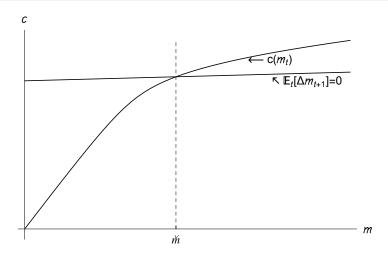

# Bounds On the Consumption Function

# The Marginal Propensity to Consume

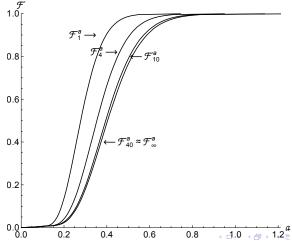

# The Consumption Function and Target Wealth

# Convergence To The Invariant Distribution

Szeidl (2012) Proves Existence of an Invariant Distribution of m, c, a, etc.

# Balanced Growth Equilibrium

Achieved When Cross Section Distribution Reaches Invariance

$$Y_{t+1}/Y_t = C_{t+1}/C_t = \Gamma$$
 (14)

Fisherian Separation Fails, Even Without Liquidity Constraints!

### Insight:

- Precautionary Saving ≈ Liquidity Constraints
- If c(m) is solution for constrained consumer,

$$\lim_{\wp \downarrow 0} c(m; \wp) = \grave{c}(m) \tag{15}$$

# Balanced Growth Equilibrium

Achieved When Cross Section Distribution Reaches Invariance

$$Y_{t+1}/Y_t = C_{t+1}/C_t = \Gamma {14}$$

Fisherian Separation Fails, Even Without Liquidity Constraints!

### Insight:

- Precautionary Saving ≈ Liquidity Constraints
- If c(m) is solution for constrained consumer,

$$\lim_{\wp \downarrow 0} c(m;\wp) = \dot{c}(m) \tag{15}$$

# Balanced Growth Equilibrium

## The MPC Out Of Permanent Shocks

http://econ.jhu.edu/people/ccarroll/papers/MPCPerm.pdf
Lots of Recent Papers Trying to Measure the MPCP

- Paper Proves:
  - MPCP < 1
  - But not a lot less:
    - 0.75 to 0.95 (annual rate) for wide range of parameter values

- Defined Conditions Under Which Widely Used Problem Has Solution
  - Finite Value of Autarky Condition Guarantees Contraction (with WRIC)
  - Growth Impatience Condition Prevents  $m \to \infty$
- Economy Of Buffer Stock Consumers Exhibits Balanced Growth
  - Even In Absence of General Equilibrium Adj of Interest Rate

Introduction
The Problem
Features Of the Solution
A Small Open Buffer Stock Economy
